

The San Bernardino County Museum Guest Lecture Series

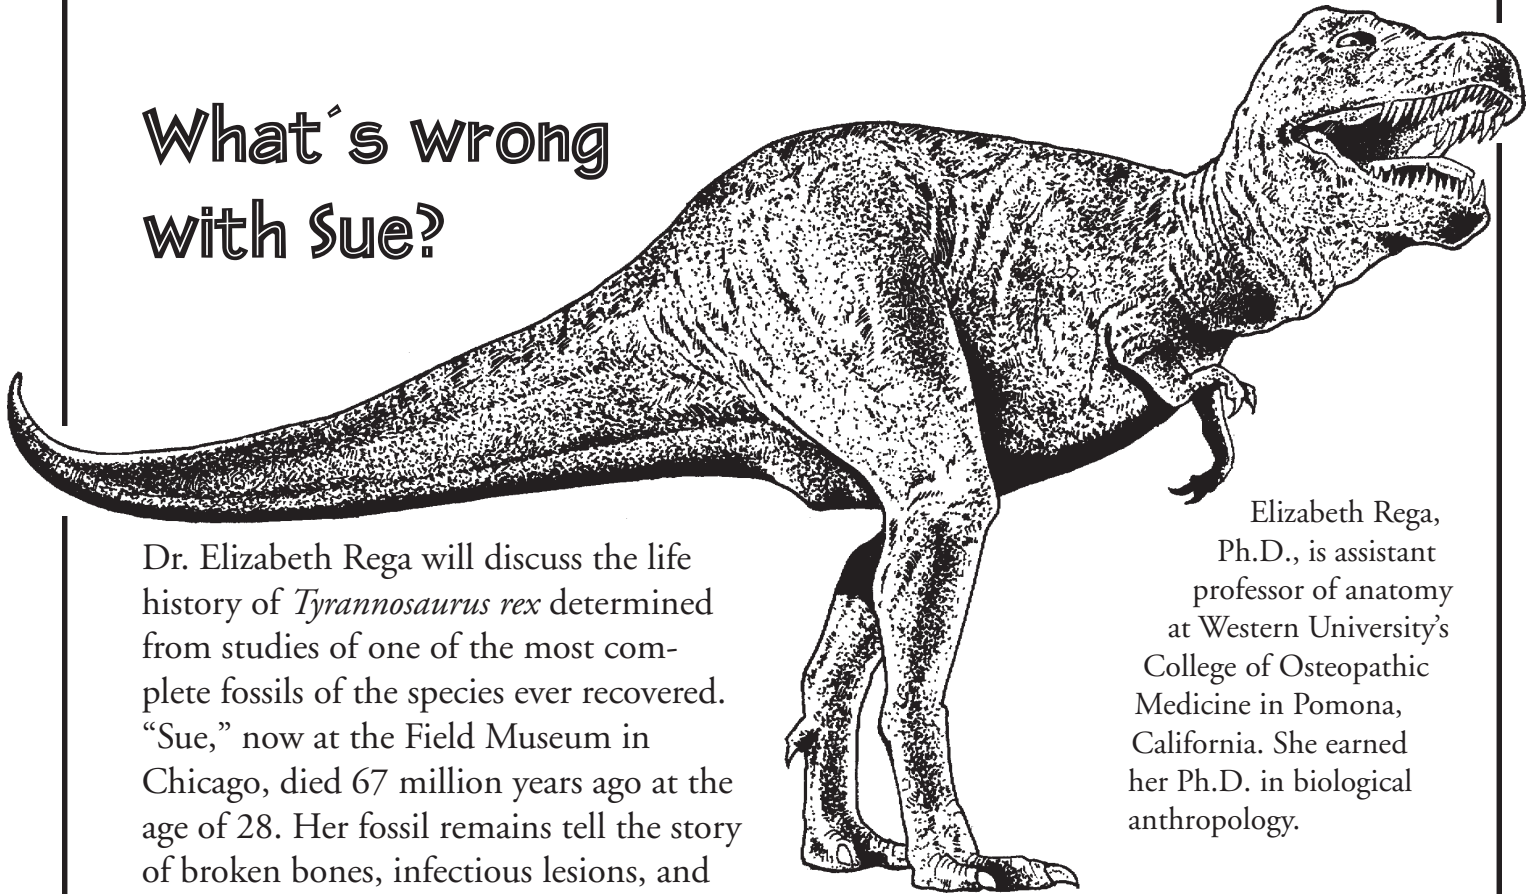

Paleopathology of the *Tyrannosaurus rex* called "Sue"

Elizabeth Rega

Western University College of Osteopathic Medicine

Wednesday, October 27, 2004 • 7:30PM • Free Admission

What's wrong with Sue?

Dr. Elizabeth Rega will discuss the life history of *Tyrannosaurus rex* determined from studies of one of the most complete fossils of the species ever recovered. "Sue," now at the Field Museum in Chicago, died 67 million years ago at the age of 28. Her fossil remains tell the story of broken bones, infectious lesions, and arthritis. Was Sue accident-prone? How does the gigantic size of some dinosaurs relate to their life history? Put on your forensic investigation hat and join us to find out just what—if anything—was wrong with Sue.

Elizabeth Rega, Ph.D., is assistant professor of anatomy at Western University's College of Osteopathic Medicine in Pomona, California. She earned her Ph.D. in biological anthropology.
